Boiler Guard K

Product:

„For a lot of problem-free heating operations years!“

Installation sample:

High-efficient recirculation pumps with permanently magnetic rotors can attract extra rust sludge and magnetite. This dirt forms in all heating systems that contain metallic components. It prevents the system from operating properly.

The Boiler Guard K collects magnetite and sludge at a central point in the heating system. This makes it easy to remove the dirt from the heating water during maintenance and service and guarantees optimum operation and protection of the system. It is quick and simple to install, as all of the functions are combined within a single unit. It is suitable for all Meibes pump groups and distributors as a system component.

The boiler guard: 4 functions in a single unit!

- | | |
|---------------------------|-------------------------------------|
| Air separator | - moves the air from a system |
| Dirt trap | - collects dirt particles |
| Magnetit separator | - binds the finest dirt particles |
| Hydraulic diverter | - supplied with or without function |
